International Advisory Group

Software Used:
Stock Manager

Tracking Item Usage

Summary:

By using Stock Manager's User tracking system, this consulting organization is able to track usage information in a stock room that supplies vacation cabanas. By substituting the Cabana number (as a scanned barcode) for the User, this customer is able to track the amount of consumable inventory items that are used in each cabana. Reporting is provided based on a date range.

While the typical Inventory functions of Stock Manager provide this customer with general Inventory control, the User function allows them to have better control over what items are being used in what Cabana during a given time period.
