Barcode +

Electronic Contractor Keeps On Top of Assets and Inventory

Summary:

When this Electrical Contractor needed a way to keep tabs on the location of its numerous pieces of equipment, spanning multiple job sites, Barcode+ offered a solution that allows them to place a barcode label on each item and maintain a record of where that item is located. They were also given a sheet of barcodes representing each truck that an item would be located. After scanning the equipment's id tag, they simply scan the item's new location or key it into the barcode scanning device using the keypad.

Skyline Electric was able to take advantage of the multiple data groups offered in Barcode+ by using a second group to keep track of their inventory items and consumables. With a barcode, a description, a quantity and a location field, Skyline is able to know what they have in stock and where that item is.

Barcode+ is a customizable multipurpose data collection and management tool that was built to handle numerous situations and data collection requirements. Barcode+ uses 4 customizable data groups each with 8 customizable fields to store information, look up entries instantly using a barcode scan, edit item information and send this information to a desktop computer.

Barcode+ was designed for both Palm and Windows Mobile platforms and works on a variety of barcode scanning devices like the Aceeca Mezura, the Janam XP30, the Symbol MC50 and MC70, Unitech PA500 and PA60, the Janam XM60 and XM65. Barcode+ includes a desktop application that's used to customize data groups, import data, view data and synchronize data to and from the barcode scanning device.
